GRADE Working Group grades of evidence
High certainty: we are very confident that the true effect lies close to that of the estimate of the effect.
Moderate certainty: we are moderately confident in the effect estimate: the true effect is likely to be close to the estimate of the effect, but there is a possibility that it is substantially different.
Low certainty: our confidence in the effect estimate is limited: the true effect may be substantially different from the estimate of the effect.
Very low certainty: we have very little confidence in the effect estimate: the true effect is likely to be substantially different from the estimate of effect.

Abbreviations: 13vPCV, 13-Valent pneumococcal conjugate vaccine; 15vPCV, 15-Valent pneumococcal conjugate vaccine; 23vPPV, pneumococcal polysaccharide vaccine; CI, confidence interval; GMC, geometric mean concentrations; GMT, geometric mean titres; ID, identification; IgG, Immunoglobulin G; LCI, lower confidence interval; OPA, opsonophagocytic activity; RCTs, randomised controlled trials; SAE, serious adverse events; UCI, upper confidence interval

Explanations

- a. Downgraded due to low number of events
- b. Mohapi 2022 included people with HIV and Hammit 2021 included Non-native Americans with at least 1 RF aged 18-64 years. Results from these populations may not be generalisable to all eligible Australians
- c. Included studies had an interval of 2 and 6 months between PCV and PPV vaccines. This differs to the 12 months interval recommended in the Australian Immunisation Handbook
- d. No studies were powered to detect a difference between 15vPCV+23vPPV and 13vPCV+23vPPV

Evidence Profile: Adults ≥18 years with specific risk factors

| Certainty assessment | | | | | | | Impact | Certainty | Importance |
|----------------------|--------------|--------------|---------------|--------------|-------------|----------------------|--------|-----------|------------|
| № of studies | Study design | Risk of bias | Inconsistency | Indirectness | Imprecision | Other considerations | | | |

Serious adverse events

| | | | | | | | | | |
|---|-------------------|-------------|-------------|------------------------|--------------------------|------|--|-------------|----------|
| 2 | randomised trials | not serious | not serious | serious ^{b,c} | not serious ^a | none | The rates of serious adverse events ranged from 0% to 1% for 15vPCV+23vPPV recipients and 1% to 4% for 13vPCV+23vPPV recipients. None were considered by study investigators to be related to the vaccine. | ⊕⊕⊕⊕ Low | CRITICAL |
|---|-------------------|-------------|-------------|------------------------|--------------------------|------|--|-------------|----------|

OPA GMT ratios (follow-up: 30 days)

| | | | | | | | | | |
|---|-------------------|-------------|-------------|------------------------|----------------------|------|--|-------------|-----------|
| 2 | randomised trials | not serious | not serious | serious ^{b,c} | serious ^d | none | The OPA GMT ratio 30 days following vaccination for shared serotypes ranges from 0.89 to 1.57. For 15v-non13v serotypes (22F and 33F) OPA GMT ratios ranged from 0.73 to 1.63. Majority of serotypes across all studies met a non-inferiority margin of 0.67. ⁵ | ⊕⊕⊕⊕ Low | IMPORTANT |
|---|-------------------|-------------|-------------|------------------------|----------------------|------|--|-------------|-----------|

% of participants ≥ 4-fold rise of GMT pre to post vaccination

| | | | | | | | | | |
|---|-------------------|-------------|-------------|------------------------|-------------|------|---|------------------|-----------|
| 2 | randomised trials | not serious | not serious | serious ^{b,c} | not serious | none | The proportion of participants with ≥4-fold rise of GMT pre PCV to post PPV vaccination for shared serotypes ranged from 44% to 88% for 15vPCV+23vPPV recipients and 45% to 87% for 13vPCV+23vPPV recipients. For 15v-non13v serotypes (22F and 33F) the proportion of participants with ≥4-fold rise of GMT pre PCV to post PPV ranged from 53% to 74% for 15vPCV+23vPPV recipients and 61% to 75% for 13vPCV+23vPPV recipients. | ⊕⊕⊕⊕ Moderate | IMPORTANT |

Abbreviations: 13vPCV, 13-Valent pneumococcal conjugate vaccine; 15vPCV, 15-Valent pneumococcal conjugate vaccine; 23vPPV, pneumococcal polysaccharide vaccine; CI, confidence interval; GMC, geometric mean concentrations; GMT, geometric mean titres; ID, identification; IgG, Immunoglobulin G; LCI, lower confidence interval; OPA, opsonophagocytic activity; RCTs, randomised controlled trials; SAE, serious adverse events; UCI, upper confidence interval

Explanations

- Downgraded due to low number of events
- Mohapi 2022 included people with HIV and Hammit 2021 included Non-native Americans with at least 1 RF aged 18-64 years. Results from these populations may not be generalisable to all eligible Australians
- Included studies had an interval of 2 and 6 months between PCV and PPV vaccines. This differs to the 12 months interval recommended in the Australian Immunisation Handbook
- No studies were powered to detect a difference between 15vPCV+23vPPV and 13vPCV+23vPPV

Evidence to Decision Framework: individual perspective

| Should 15vPCV (followed by 23vPPV) be used in adults ≥18 years old with specific risk conditions (as in HB list) for the prevention of pneumococcal disease? | | | | | |
|---|--|----|-------------|--------------|-----|
| Population | Adults ≥18 years with specific risk factors | | | | |
| Intervention | 15-valent pneumococcal conjugate vaccine with subsequent 23-valent pneumococcal polysaccharide vaccine | | | | |
| Comparison | 13-valent pneumococcal conjugate vaccine with subsequent 23-valent pneumococcal polysaccharide vaccine | | | | |
| Main outcomes | Immunogenicity: OPA and IgG geometric mean titres - OPA GMT ratios (follow-up: 30 days) - % of participants ≥ 4-fold rise of GMT pre to post vaccination - IgG GMC ratios (follow-up: 30 days) - % of participants ≥ 4-fold rise of GMC pre to post vaccination Safety: with 23vPPV after previous 15vPCV or 13vPCV delivery - Severe adverse events (SAE) - Injection site adverse events - Systematic adverse events | | | | |
| Setting | USA, South Korea, Spain, Taiwan, Canada, Chile, Poland, Australia, New Zealand, France, Peru, South Africa, Thailand | | | | |
| Perspective | Individual | | | | |
| ASSESSMENT | | | | | |
| Problem | | | | | |
| <i>Is the problem a priority?</i> | | | | | |
| Don't know | Varies | No | Probably No | Probably Yes | Yes |
| <ul style="list-style-type: none"> In Australia about 800 cases of invasive pneumococcal disease (IPD, the severe form of pneumococcal disease) occurs annually.¹¹ The incidence of all community acquired pneumonia caused by pneumococcus is several fold higher than IPD.¹² Serotypes that cause pneumococcal disease in those with risk conditions is more diverse compared to others. With the use of PCVs over several years with high coverage certain non-PCV serotypes have emerged with increasing IPD incidence and this replacement disease is more pronounced in the population with risk conditions. PCVs with extended valency would likely improve protection against pneumococcal disease in individuals with underlying risk conditions.. | | | | | |
| Desirable effects | | | | | |
| <i>How substantial are the desirable anticipated effects?</i> | | | | | |

| | | | | | | |
|---|---|--------------------|--|---|-------------------------------|----------------------|
| Don't know | Varies | Large | Moderate | Small | Trivial | |
| <ul style="list-style-type: none"> There is variability in the evidence of immunogenicity outcomes of 15vPCV+23vPPV compared with 13vPCV+23vPPV. Although there are small effects at improving immunogenicity outcomes for 15v-non13v serotypes from the 15vPCV, these benefits are diminished following 23vPPV vaccine. There is no evidence available on clinical outcomes after 15vPCV and no evidence available on the persistence of 15vPCV+23vPPV vaccination | | | | | | |
| Undesirable Effects | | | | | | |
| <i>How substantial are the undesirable anticipated effects?</i> | | | | | | |
| Don't know | Varies | Large | Moderate | Small | Trivial | |
| <ul style="list-style-type: none"> Undesirable effects include frequent rates of injection site adverse events and systemic adverse events which are mostly of mild to moderate severity. Rates are similar to those seen after 13vPCV+23vPPV. There were no vaccine-related serious adverse events in the included studies. | | | | | | |
| Certainty of evidence | | | | | | |
| <i>What is the overall certainty of the evidence of effects?</i> | | | | | | |
| No Included Studies | Very Low | Low | Moderate | High | | |
| <ul style="list-style-type: none"> The certainty of evidence is moderate due to imprecision as some studies were not powered to detect a difference between 15vPCV and 13vPCV | | | | | | |
| Values | | | | | | |
| <i>Is there important uncertainty about or variability in how much people value the main outcomes?</i> | | | | | | |
| Important uncertainty | Possibly important uncertainty or variability | | Probably no important uncertainty or variability | No important uncertainty or variability | | |
| <ul style="list-style-type: none"> Unlikely to be important uncertainty in how people value protection against pneumococcal disease. | | | | | | |
| Balance of effects | | | | | | |
| <i>Does the balance between desirable and undesirable effects favour the intervention or the comparison?</i> | | | | | | |
| Don't Know | Varies | Favours comparison | Probably favours comparison | Does not favour either comparison or intervention | Probably favours intervention | Favours intervention |
| <ul style="list-style-type: none"> 15vPCV+23vPPV was found to have similar desirable and undesirable effects compared to 13vPCV+23vPPV. Although there are small effects at improving immunogenicity outcomes in the 15v-non13v serotypes from the 15vPCV vaccine, these benefits are diminished following 23vPPV vaccine. Undesirable effects are minor | | | | | | |
| Acceptability | | | | | | |
| <i>Is the intervention acceptable to key stakeholders?</i> | | | | | | |
| Don't know | Varies | No | Probably No | Probably Yes | Yes | |

| | | | | | |
|--|--------|----|-------------|--------------|-----|
| <ul style="list-style-type: none"> Vaccination to prevent pneumococcal disease appears to be acceptable in the Australian setting. In 2016 vaccination uptake of the 23vPPV vaccine in adults aged ≥ 65 years was estimated to be 52%¹³. The vaccination uptake in adults aged ≥ 18 years is likely to be lower. | | | | | |
| Feasibility <i>Is the intervention feasible to implement?</i> | | | | | |
| Don't know | Varies | No | Probably No | Probably Yes | Yes |
| <ul style="list-style-type: none"> Minimal barriers in implementation, as vaccine delivery system already in use and this vaccine would likely replace the use of another vaccine for the individuals receiving it | | | | | |
